

Software Requirements Specification (SRS)

Application Suite: Clockwise Workforce Management System (WMS) & Clockwise TimeClock

Purpose: Comprehensive workforce and attendance management system for multiple clients

1. Introduction

1.1 Purpose

This SRS defines requirements for two applications:

1. Clockwise WMS: Manager-focused application for employee, client, shift, and schedule management.
2. Clockwise TimeClock: Employee-facing application for clock-in/out and notifications.

1.2 Scope

- WMS: Employee management, client and shift creation, scheduling, approvals, leave, payroll, reporting, and notifications configuration.
- TimeClock: Attendance tracking, geo-fencing, PIN/fingerprint login, photo capture, auto clock-out, reminders, and notifications.

2. User Roles & Access

Role	Application	Permissions
Admin	WMS	Full system access, user & role management, configuration
Talent Manager	WMS & TimeClock	Manage shifts, confirm attendance, send reminders, proxy clock-in/out
Shift Supervisor	WMS	Approve employee hours for shifts
Client Manager	WMS	Oversee clients, approve shifts & employee hours
Employee	TimeClock	Clock in/out, confirm shifts, receive notifications

3. Clockwise Workforce Management System (WMS)

3.1 Purpose

WMS is a manager-focused system that allows adding employees, managing clients, shifts, schedules, approvals, leave, payroll, and reporting. Employees do not access WMS.

3.2 Functional Requirements

3.2.1 Employee Management - Employee Master Page: add, edit, terminate, search, filter

- Bulk employee import via CSV/XLSX
- Employee profile fields: Name, contact info, role, wage, payment mode, work authorization, client & shift assignments, attachments

3.2.2 Client Management - Create clients , search and edit

Configure shift details for a client: - Start/end times

- Attendance windows
- Break rules (default 30 minutes, configurable per client)
- Rounding rules (up/down, client-specific)
- Auto clock-out duration (X minutes) for employees who forget to clock out – configurable per client
- Geo-fencing distance (default 150 feet) – configurable per client

3.2.3 schedule Management -

- Assign employee to client and add to schedule – i.e assign shift to employee

3.2.4 Leave Management - Talent Manager can mark approved leave

- Notifications sent to Shift Supervisor and Client Manager via Email, SMS, Push

3.2.5 Notifications - Configure notification events and channels for employees and managers

- Enable/disable Email, SMS, Push, Phone per client or shift

3.2.6 Reporting - Attendance reports: current & previous pay periods

- Shift schedule reports per client
 - Export employee records (CSV/XLSX/PDF)
 - Admin can control who can access/download which reports
-

3.3 Non-Functional Requirements

- Mobile-first design, responsive on tablets/desktops
 - Secure storage with role-based access
 - Audit logs for all actions (employee, shift, approvals, reports)
 - Scalable for multiple clients and thousands of employees
-

4. Clockwise TimeClock

4.1 Purpose

TimeClock is an employee-facing application that allows employees to clock in/out and receive notifications for shifts and attendance.

4.2 Functional Requirements

4.2.1 Attendance - Geo-fencing: Clock-in/out allowed only within distance configured in WMS per client

- Authentication:
- PIN-based login (iPad/shared tablet)
- 6-digit PIN assigned in WMS per employee
- Fingerprint login (tablet only)
- Mobile login (phone app)
- Photo captured automatically at clock-in/out
- Auto clock-out: Automatically clocks out employees if they forget to clock out, using duration configured in WMS per client
- Proxy clock-in/out by Talent Manager
- Employee confirmation via app or SMS (“Yes/No”)

4.2.2 Notifications - Notify employees about:

- Shift assignment & schedule updates
 - Upcoming shifts
 - Clock-out & break-end confirmations
 - Task assignments / overdue tasks
 - Channels: Email, SMS, Push, Phone
-

4.3 Non-Functional Requirements

- Real-time notification delivery
 - Handle concurrent clock-ins/out on tablets
 - Secure storage of attendance, photos, and location
 - Integration with WMS for payroll and reporting
-

5. Technology Stack & Architecture

5.1 Front-End

- Flutter (iOS & Android)
- Mobile-first UI/UX
- Shared UI components for both applications

5.2 Back-End

- Node.js REST API
- Secure, scalable, role-based access control
- Notifications, geolocation, attendance, and reporting services

5.3 Architecture

- Client-server architecture
- Shared back-end services: Employee management, shift & attendance, notifications, reporting, payroll
- Data encrypted in transit and at rest
- Audit logging for all actions

5.4 Deployment

- iOS App Store (iPhone/iPad)
- Google Play Store (Android phones/tablets)

- Optional web portal for WMS
-

6. Assumptions & Constraints

- SMS/phone notifications depend on third-party gateways
 - Fingerprint scanners on tablets are external
 - Geo-fencing accuracy depends on device GPS
 - Employees cannot access WMS
-

7. Future Enhancements

- Payroll integration
- AI-based attendance anomaly detection
- Facial recognition
- Web portal for advanced reporting
